

RUN IT ON YOUR OWN MACHINE

From download to a live call in about ten minutes

Everything runs on free tiers. You need one free API key and no credit card. The knowledge base ships already built, so there is nothing to scrape and nothing to wait for.

PYTHON

3.11 or newer
python.org/downloads

AUDIO TOOL

ffmpeg
ffmpeg.org/download.html

API KEY

Groq, free
console.groq.com

SOURCE

Git or ZIP
github.com

BROWSER

Chrome or Edge

for the microphone

DISK

About 1 GB

no GPU needed

01 Get a free Groq API key

- Go to console.groq.com and sign in with Google, GitHub or email.
- Open **API Keys** in the left menu and click **Create API Key**.
- Give it any name and copy it. It starts with `gsk_` and is shown only once.
- No payment details are asked for. The free tier is enough to run everything.

02 Download the project

- **With Git:** run the two lines below in a terminal.
- **Without Git:** on the GitHub page click **Code** → **Download ZIP**, then unzip it.

```
git clone https://github.com/aviral780/The-Darwix-Voice-Agent-.git
cd The-Darwix-Voice-Agent-
```

03 Install Python and ffmpeg

- **macOS:** `brew install python@3.11 ffmpeg`
- **Windows:** `winget install Python.Python.3.11 Gyan.FFmpeg`, then reopen the terminal.
- **Linux:** `sudo apt install python3.11 python3.11-venv ffmpeg`
- Check both are ready: `python3 --version` and `ffmpeg -version`

04 Install the dependencies

- From inside the project folder. This takes a minute or two.

```
# macOS / Linux
python3.11 -m venv .venv
.venv/bin/pip install -r requirements.txt
```

```
# Windows
py -3.11 -m venv .venv
.venv\Scripts\pip install -r
requirements.txt
```

05 Add your key

- Copy the template: `cp .env.example .env` (Windows: `copy .env.example .env`)
- Open `.env` in any text editor and paste your key after `GROQ_API_KEY=`
- The other two lines are optional and can stay empty.

```
GROQ_API_KEY=gsk_your_key_here
```

06 Start the server

```
# macOS / Linux
.venv/bin/python -m uvicorn agent.server:app
--port 8000
```

```
# Windows
.venv\Scripts\python -m uvicorn
agent.server:app --port 8000
```

- Wait about ten seconds the first time while the language model for search loads.
- Open `http://127.0.0.1:8000` in Chrome.
- To stop it, press `Ctrl + C` in the terminal.

07 The three pages

/

Call console

Pick a market and talk to the agent. Click the mic once and speak; it sends when you stop. Live coaching runs beside the call. You can type instead of speaking.

/kb

Knowledge base

Ask any question and watch both checks decide whether an answer is allowed, with the source passage and its scores.

/live

Live insights

Play one of four recorded calls with sound and watch nudges appear mid-call, or speak into it yourself as the agent or the customer.

08 Things worth trying on the call console

"What happens if I miss a premium payment?"	answers, with its source
"What is my current policy account balance?"	declines, offers a person
"My wife and two kids depend on me."	coaching nudge appears
"Can I speak to a real person?"	hands over, ends the call

Switch to the Taglish or Bahasa market from the first screen to hear the same engine in another language.

09 Where to find the results

Everything below is already in the repository. Nothing needs to be run to read it.

Recorded calls, English and localised	evidence/calls/
Transcripts of every call	evidence/transcripts/
Recordings used for live nudges	evidence/live_calls/
Leads the agent created	data/leads/
Knowledge base test results	docs/retrieval_results.md
Latency and nudge results	docs/latency_report.md
Localisation and speech tests	docs/q3_localization.md
How it fits together	docs/architecture.md
Known gaps	docs/limitations.md

10 If something goes wrong

- **Port already in use:** add `--port 8001` and open that port instead.
- **Microphone does nothing:** allow microphone access in the browser, or type your reply.
- **"ffmpeg not found":** install it (step 03) and reopen the terminal.
- **Slow replies or a "try again" message:** the free tier's per-minute limit. Wait a minute between calls.
- **No sound on /live:** click the page once first. Browsers block audio until you interact.
